

## Credibility Symbols

Credibility symbols have been created for each category of picture that can be distinguished on the website. These symbols have been generated following the rules of visual design and provide easy information to the users about the picture classification.

**Trustworthy Image** – This symbol represents that the image is trustworthy and true to its assertion. In this case, we can interpret that the image credibility provided by the user matches to the original image.

**Untrustworthy Image** – This symbol represents that the image is untrustworthy and untrue to its assertion. In this case, we can interpret that the image credibility provided by the user does not match to the original image.

## Image Categories:

**Scanned Image** – It represents the scanned images uploaded by the user. The symbol depicts a scanner and an image being scanned by the user to present the idea of an original image being scanned for uploading.

**Manipulated Image** – It represents the manipulated images uploaded by the user. The symbol is a combination of an image and a paint brush to depict the idea of artistic manipulation. All levels of manipulation are considered under this category such as photoshopped images, enhanced image composition, edited images.

**Photograph** – It represents original photographs uploaded by the user. The camera symbol is used to give a direct indication to photographs and can be associated to original creations.

**AI Generated Image** – This symbol represents image generated artificially using AI tools. The symbol is a combination of an image with cables representing computer-generated work, indicating the image is a generated output using AI tools.

## **Categories for Image Credibility Checks:**

**Registered User** – It represents that the source of the image is confirmed to be a registered user and the user is responsible for the credibility of the image as described in the image description.

**Machine- learning test passed** – It represents that the image has passed the detection check and is true to its asserted type provided in the image description by the user.

**Image metadata** – It represents that the image metadata is according to the desired standard and contains all the necessary information required to validate image credibility.
